Mass Effect Trilogy.[Cracked][Mods][Need Fix] Dec 6, 2019 [Closed] You have read and agree to the terms of our Privacy Policy While other automakers have found success with electric cars, the Japanese are leading the pack in an entirely different form of transportation. Hydrogen fuel cell cars are starting to gain a bigger presence in the car market, as more and more automakers start looking at the technology as a way to decrease their emissions and save money on gas. But some experts say that hydrogen is just not ready for wide-scale implementation, and that some of its drawbacks could become a fatal blow to its growing popularity. Hydrogen cars have a lot of advantages over those powered by gasoline or batteries. For starters, the only emissions they produce are water vapor, and that is an environmental plus in a time when other forms of transportation are becoming more and more environmentally destructive. At this point, they are also more convenient than their internal-combustion-engine competitors. There's no need to plug in each time you want to take a trip, and they also make for a more quiet and comfortable drive. What has a number of experts worried, however, is that the fuel cell technology used by hydrogen cars is still under development, and that there are only a limited number of automakers and energy companies developing the technology at any one time. With the cars still in their early stages, many critics are saying that hydrogen fuel cell cars are not ready for the market as they are currently conceived. The first hurdle that hydrogen cars need to overcome is the cost of developing the technology. When Toyota first came out with the first fuel cell car, the fuel cell only produced a small amount of power, and the price was also quite high. It took the company years to ramp up the price and make it more affordable. In fact, the first Toyota fuel cell car cost thousands of dollars more than an electric car at the time, which prevented people from buying it. For the most part, fuel cell technology continues to be at least six times more expensive than gasoline, as well as twice as expensive as other alternative fuel options like 82138339de
